7 Questions People Commonly Ask About ZYTO Technology

How does the technology work?

In the most basic terms, ZYTO technology uses quantum physics as well as established Galvanic Skin Response (GSR) technology to measure fluctuations in electrical conductivity of the skin. A client places their hand on the hand cradle, the ZYTO software sends stimuli to the body using digital signatures that represent actual things, and the fluctuations in GSR are measured and interpreted. The response helps the practitioner to see how the body responds to the items being assessed, which ones it prefers, and how much it prefers them. This knowledge is used by healthcare practitioners to maximize their results by helping them choose the right solution for their clients at the right time.

Are the results accurate?

Yes. ZYTO practitioners have performed tens of thousands of assessments worldwide. Practitioners have also used other modalities to evaluate the results of their ZYTO software with great results. Recently, a hospital study was conducted that showed a 95.2% correlation between the results of ZYTO's technology and the recommendations of the doctor.

How can I experience this amazing technology?

ZYTO currently offers two professional systems that are available to certified health professionals as well as a new system that is available for consumers to buy. The best way for non-certified individuals to experience the power of the professional systems would be to schedule an assessment with any of the hundreds of health professionals who use ZYTO's technology in their clinics throughout the world. For more information regarding any of our systems or to get the name of the ZYTO professional nearest you, call us at 801-224-7199.

Are the results reproducible?

One of the most common questions that arises as people are getting to know the technology and how it works, is why the actual data from the scans changes from one assessment to another. As a matter of fact, because of what we are measuring, we don't expect reproducibility. ZYTO technology measures the most rapidly changing field in the body, the energetic field, which processes 400 million impulses of information per second. When dealing with complex mind-matter systems repeatable measurements are not expected. Instead you look for patterns and trends.

Are there any research studies on the technology?

There are myriad studies that have been conducted over the last century on GSR and its use in measuring the body's reaction to stimuli. In addition, several independent studies have been conducted by health professionals using ZYTO's technology.

Can the technology be used to treat or diagnose?

ZYTO technology is not designed to treat or diagnose. It is a tool designed to assist the healthcare practitioner in finding the body's preferences for any list of items. This information is invaluable in helping the practitioner determine which product is going to maximize therapeutic results for the client.

Do you have FDA approval?

ZYTO's technology does not qualify as a medical device and therefore does not require FDA Approval. We are always reviewing the changes in the industries and the laws of the countries we operate in to remain in compliance.
